Worksheet on Data Handling

1. A bar graph shows the daily routine of Adam.

How many extra hours are spent on schooling and studying than sleeping?

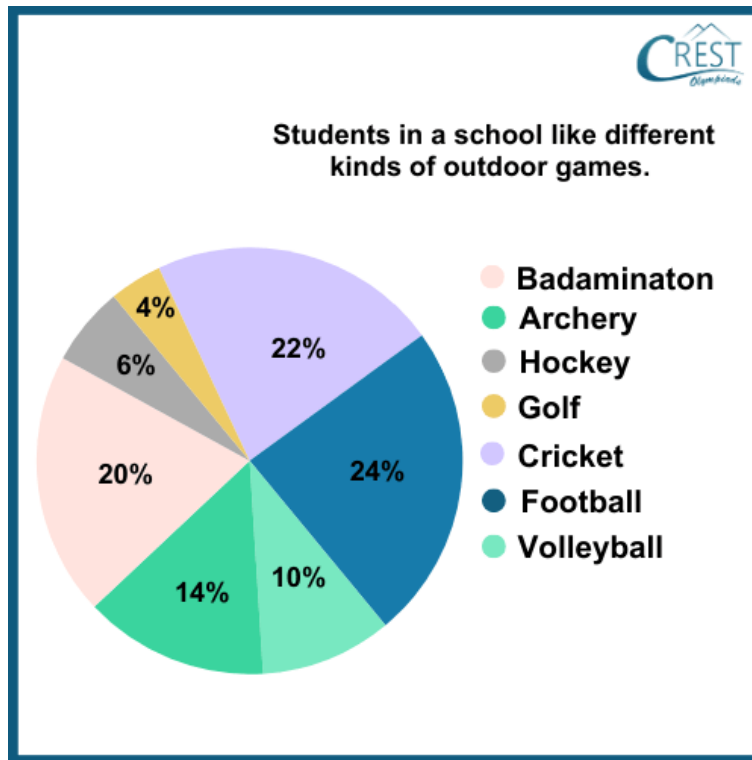

- a. 5 hours
 - b. 7 hours
 - c. 9 hours
 - d. 11 hours
2. The bars of the histogram denote the production of cereals in the different years. Study the histogram carefully and answer the question.

What is the range in tons of production of cereals from 2018 to 2023?

- a. 0.1 tons
- b. 10 tons
- c. 100 tons
- d. 1000 tons

3. The pie chart shows how many students in a school like different kinds of outdoor games.

How many more students like hockey and archery than badminton, volleyball, hockey and golf if the total strength of students in a school is 4595?

- a. 909 students
- b. 919 students
- c. 1818 students
- d. 1838 students

4. Find the median of the given data:

25, 14, 32, 58, 45, 63, 38

- a. 14
- b. 25
- c. 38
- d. 58

5. Read the events carefully and answer the question.

Event A: Keith Warne tosses two coins simultaneously. He gets at least two heads.

Event B: Donald McGrath tosses two coins simultaneously. He gets at least one head.

Event C: Rodger Waugh tosses two coins simultaneously. He gets at most one tail.

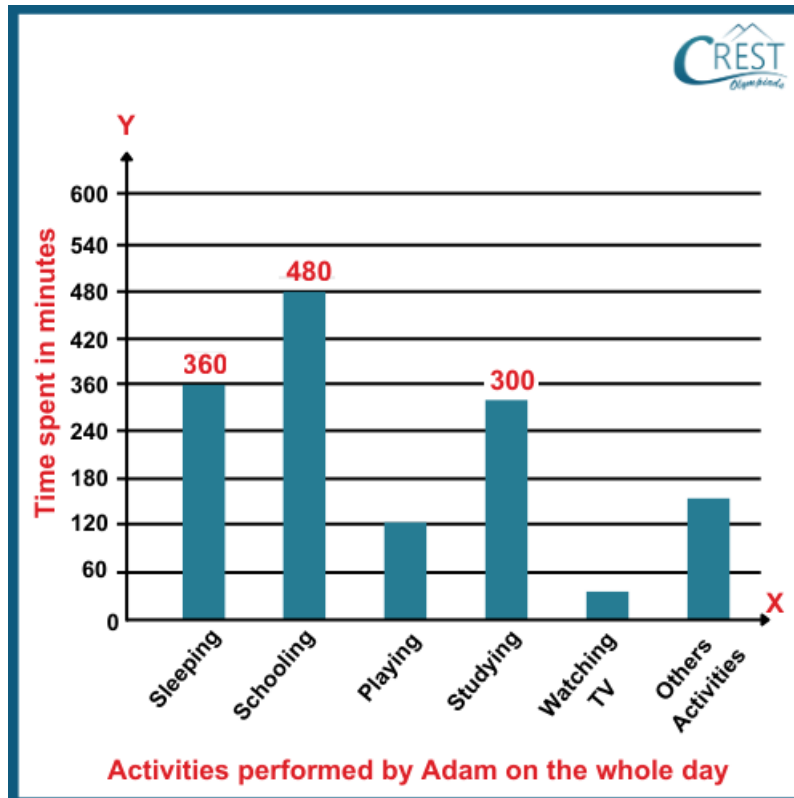

Which of the above event(s) has a probability equal to 0.50?

- a. All events A, B and C
- b. Only event A
- c. Only event B
- d. Only event C

Answer Key

1. b - 7 hours

Explanation: Time spent on schooling, studying and sleeping are shown in the graph:

Time spent on schooling = 480 minutes = $480/60 = 8$ hours

Time spent on schooling = 300 minutes = $300/60 = 5$ hours

Time spent on sleeping = 360 minutes = $360/60 = 6$ hours

Extra hours spent on schooling and studying than sleeping = $(8 + 5) - 6$

= $13 - 6$

= 7 hours

2. c - 100 tons

Explanation: Highest cereals production in 2021 = 1250 quintals

Lowest cereals production in 2023 = 250 quintals

[1 ton = 10 quintals \Rightarrow 1 quintal = 1/10 tons]

Range in tons of production of cereals from 2018 to 2023

= Highest cereals production in 2021 – Lowest cereals production in 2023

= 1250 – 250

= 1000 quintals

= 1000/10 tons

= 100 tons

3. b - 919 students

Explanation: Total number of students in a school = 4595

Percentage of students who like hockey and archery = 6% + 14% = 20%

Number of students who like hockey and archery = 20% of 4595

= 20/100 \times 4595

= 919 students

Percentage of students who like badminton, volleyball, hockey and golf

= 20% + 10% + 6% + 4%

= 40%

Number of students who like badminton, volleyball, hockey and golf

= 40% of 4595

= 40/100 \times 4595

= 1838 students

Number of students who like hockey and archery more than badminton, volleyball, hockey and golf = 1838 – 919 = 919 students

4. c - 38

Explanation: Arrange the given data in ascending order:

14, 25, 32, 38, 45, 58, 63

n = 7

$$\text{Median} = \left[\frac{(n + 1)}{2} \right]^{\text{th}} \text{term}$$

Median = $(7 + 1)^{\text{th}} / 2$

= $8^{\text{th}} / 2$

= 4^{th}

The 4^{th} term in the given data:

14, 25, 32, 38, 45, 58, 63

The median is 38.

5. d - Only event C

Explanation: Two coins are tossed. Total number of outcomes (HT, TH, HH, TT) = $2 \times 2 = 4$

Event A: Keith Warne tosses two coins simultaneously. He gets at least two heads.

Probability of getting at least two heads (HH) = $\frac{1}{4} = 0.25$

Event B: Donald McGrath tosses two coins simultaneously. He gets at least one head.

Probability of getting at least one head (HT, TH, HH) = $\frac{3}{4} = 0.75$

Event C: Rodger Waugh tosses two coins simultaneously. He gets at most one tail.

Probability of getting at least one tail (HT, TH) = $\frac{2}{4} = \frac{1}{2} = 0.5$

Therefore, only Event C has a probability equal to 0.50.
